

### **Detailed Design**

# Team sdmay25-33

# Advisor: Phillip Jones

Caden Otis, Devin Alamsya, Justin Cano, Joseph Krejchi, Rachel Druce-Hoffman

### **Project Overview**

- Create an interactive application for CPRE 2880 students to better understand the concepts
  - HWs and quizzes
  - Randomized questions and autograding
  - Use emulation tools to simulate microcontrollers
  - Potentially have an emulated Cybot robot interface
- PrairieLearn framework to host the application
- Utilize Python, JavaScript, C and other programming languages
- Hope to inspire other professors to build similar interactive tools for their students

#### HW1.1. Embedded Systems Applications Which of these appliances/products use an embedded-processor? Drag from here: Construct your solution here: Acoustic guitar Basketball Calculator Printer Screwdriver Shovel Vending machine Washing machine Save & Grade Single attempt Additional attempts available with new variants

### **Problem Statement**

- Students don't get enough practice of concepts
  - Little feedback on Canvas HW submissions
- Not always availability to practice programming on the microcontroller in the lab
- Limited time to meet with Professor and TAs
  - Lab, class, office hours
- Limited capabilities with Canvas platform

### **Detailed Design and Visuals Overview**

### Detailed Design and Visuals (1)

#### Server:

- Contains several security measures
  - Firewall, NGINX, and SSH security
- Connections allowed through ports 22 (SSH), 80 (HTTP), and 443 (HTTPS) only
- Network traffic gets encrypted when going to PrairieLearn container
- Houses several autograder containers for simultaneous question grading

### **Detailed Design and Visuals (2)**

#### PrairieLearn:

- Allows users to create online courses with question sets, automatic grading and feedback, and gradebook integration
- Authentication for ISU students and professors
- Instructors can create courses with specific instances for each semester
- Students are provided with an interface that makes it easy to learn and engage with the questions
- Info.json handles question configuration
- Server.py handles question generation and randomization
- Question.html handles the UI of questions

Course				
Instance				
Homework 1				Question
Question 1 Quest	on 2	Question n		info.json
				question.ht
Homework 2			1	sanar n
Question 1 Questi	on 2	Question n		test files fi autograde
Homework n			7	
Question 1 Questi	on 2	Question n		
User Accounts				
User Accounts	TAs	Students		
User Accounts	TAs	Students		
User Accounts Professors	TAs	Students		
User Accounts	TAs	Students		

### Functionality

- Course instance will be reachable from Canvas
- Our project will be interactive and user friendly
- Questions will be randomized for every student
  - Students can get additional randomized instances of questions for more practice
- Students will answer questions in a variety of formats
  - Multiple choice, matching, writing code, etc.
- Most questions will be autograded for instant feedback
  - Professors and TAs can give additional feedback as well
- Grades will auto populate in the Canvas gradebook

### **Technology Considerations**

- Virtual Machines
  - ETG-issued
  - Personal VMs for development
  - Ubuntu 22.04
- Git, Gitlab
  - Version control
  - Repo attaches to server

### Areas of Concern and Development

- Legacy project: in development but doesn't fit user needs yet
- Areas of concern
  - Visual cohesiveness
  - Adequate questions
    - Complex, engaging coded elements
  - ISU authentication integration
  - Security

### Conclusion

- Detailed understanding of project is crucial to implementation
- Our project is almost all software-based
  - Many individual code pieces to have work together
  - Different coding languages
- Through knowing our design's intricacies, we can plan development better and prevent errors

# Any Questions or Suggestions?
